M7 focused corrections - synthetic issue-rich review

Schema 1.6 · image_reliability_v1 · 2026-10-12T04:35:28.735800+00:00. Strict JSON retains the complete bounded evidence. Resource settings are safeguards, not capacity guarantees.

10 evidence-qualified findings across 13 image occurrences; completed execution.

Authored controls demonstrate concurrent integrity problems, declared separation, compatibility blockers and a changed mask. No customer content.

> **COMPLETED** · 13 occurrences. Completion describes audit execution, not dataset acceptance. No universal image-quality score. Similarity does not prove leakage or identify a correct annotation. Images, labels and source paths are excluded unless explicitly disclosed.

Priority review actions

Review integrity and declared separation first, then compatible changes and investigation candidates. Counts below have different populations and must not be added into a quality score.

1. Resolve source and identity problems

deterministic facts

- 1 image locations could not be decoded.
- 2 occurrences have ambiguous logical keys.
- 1 source/reference diagnostic reasons need resolution.

Next action: Inspect the retained local references, repair the declared sources or keys, then re-audit. Dependent comparisons cannot establish a clean result.

---

2. Resolve declared split separation

declared requirements

- 4 left-side occurrences repeat exact bytes across a declared separation.
- 5 left-side occurrences share declared groups (per_key matching).
- Group separation has missing values or unresolved key/namespace populations; inspect its disclosed scope.

Next action: Review the overlapping asset/group membership and revise the split assignment or declaration. This evidence does not prove training exposure or evaluation inflation.

---

3. Review annotation integrity

facts and compatible differences

- 5 occurrences have invalid or partially valid annotations; reason counts can overlap.
- Some geometric checks are blocked; source views do not establish aligned annotation agreement.
- 1 exact-raster groups have compatible normalized annotation differences.
- 2 differing annotation groups cannot be geometrically compared.

Next action: Inspect supplied states, taxonomy and coordinate frames. Correct declared violations; adjudicate compatible differences locally. The audit does not identify the correct label.

---

4. Resolve comparison and coverage limits

changes and coverage boundaries

- Version alignment is blocked; only population and exact-content overlap are available.
- 1 aligned occurrences have compatible annotation changes.

Next action: Review the aligned changes and blocked populations. Supply compatible declarations where possible, or explicitly accept the bounded scope before making a dataset decision.

---

5. Investigate visual and repetition evidence

declared quality rules and review candidates

- 6 explicit visual-quality rule violations (not unique-image counts).
- 3 perceptual raster pairs are available for investigation.
- 9 cross-split occurrences with exact byte repetition are available for investigation.

Next action: Apply explicit quality expectations separately from similarity candidates. Inspect examples locally; similarity alone proves neither leakage nor an incorrect label.
